

## Commissioning/Service Support First-Hand Knowledge

Westfalia Separator Engineering offers you professional personal support for installation and commissioning. The specialist know-how and the decades of experience gained by our qualified technicians and engineers guarantee you optimum support.

Invest your trust in our international specialist competence.

Westfalia Separator will assign you competent contacts world-wide. To ensure the availability of qualified personnel even in the event of unexpected service call-outs and scheduling conflicts, we offer professional and qualified support specifically for the complex area of automation.

### **We help, you save**

In the extremely sensitive area of the interfaces between process, machine, drive and control technology a highly qualified commissioning techni-

cian will help you to save time and money – whether during the installation, integration or commissioning of machines, installations and control systems.

Our experts are specialised to meet these high demands: They are well trained in process engineering, have received mechanical and electrical education and are right up to date as far as automation is concerned. On your site, they optimise assembly procedures through installation supervision or help you minimize downtimes through trouble shooting using their world-wide experience.

## Training/Product Support Know-how from Practical Experience

Westfalia Separator Engineering's approach is direct knowledge transfer: our own training engineer ensures world-wide qualified training of employees and customers.

With the steadily growing number of electrotechnical components and the progressive automation of our centrifuges, there is a sharp increase in the demand for electrotechnical training courses. Our training engineer has the job of arranging advanced training courses for our service and sales personnel and carrying out customer training. Depending on the topic and field, he is supported by experienced specialists from the different fields of application.

The training courses do not only take place at company headquarters, but also world-wide in the subsidiaries and on site at the customer. Even in basic training dealing with topics like safety, motors and frequency converters, there is a special focus on the practical side.

### Knowledge on demand

Besides learning how to read our circuit diagrams, how to operate our standard controls and parameterisation of frequency converters, the training sessions also deal with sensor technology in the installation, for example speed, vibration and temperature monitoring, flow and turbidity measurement.

The theme spectrum is entirely customized to your wishes: special topics such as field bus connection (Industrial Ethernet, Profibus), tips on EMC (electromagnetic compatibility: cable laying, screening, grounding) or specific aspects of explosion-hazardous areas can be included as additional modules.
