

Environmental Technology – Control Engineering Everything Under Control

Customized control engineering from Westfalia Separator Engineering provides optimum flexibility and ensures individually specified process results.

Our control engineering offers you the possibility of optimizing your processes and simultaneously improving efficiencies. It comes into play when there is a need to minimise process materials consumption or when the separation requirements change.

Optimization of your processes – using all the tools of the trade

Proven solutions for reliable results

In automated operating mode, the controls adjust all necessary parameters largely independently, thereby supporting and unburdening the operating personnel – and you too as plant operator.

Whether a high dewatering efficiency, an excellent separation efficiency or energy-saving operating mode is desired: our modern control engineering always adapts the plant to your current needs.

Our control engineering cuts the operating costs, ensures economical operation and will likewise impress you when retrofitted in existing machines.

Environmental Technology – Automation Engineering Clear Advantages

The automation of your clarifying treatment plant gives you decisive advantages in all areas – from the automatic feed control, the scroll torque regulation optimally adapted to the sludge conditions right through to visualization of the operating costs.

Our plant automation guarantees you a constantly optimum flexibility through simple process integration, high economy in operation and maintenance and the greatest possible preservation of environment and resources.

Automation is a genuine optimisation package for the operation of decanters in the environmental technology sector. Automated operation, improved efficiency or a lower process material consumption give you a direct additional benefit which quickly pays off.

flexible, economical, environmentally-friendly – automation engineering from Westfalia Separator Engineering

Automatically better

We always offer you state-of-the-art solutions – both for simple installations as well as for fully automated process lines. Decanters and controls form an organic unity and are also jointly tested: because only this complete solution consisting of machine and controls can be designed and certified in accordance with

the CE requirements.

Take advantage of our competence: our process engineering know-how gained over decades and the experience gained world-wide is continuously incorporated in our automation systems.
